

Dry Cells and a Miniature bulb

One Dry Cell

It is a law of
 Although
 notheing has
 changed at
 miniature bulb
 side., the current
 from a battery
 will always be
 by halves why.
 ?

A pair of a Dry Cell

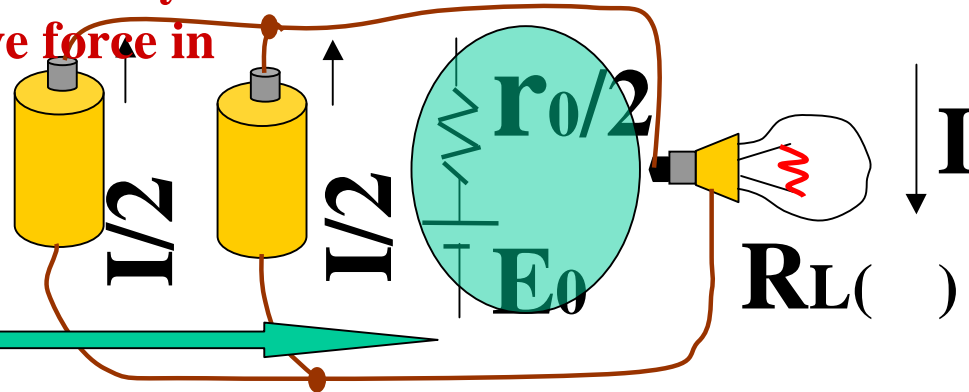

Study at School (Consider the internal r in Dry Cell) Use Thevenin's theorem

I represent a current flow in the dry cell.
 r_0 represent internal resistance in a dry cell.
 E_0 represent Electro-motive force in a dry cell.

$$I = E_0 / (r_0/2 + R_L)$$

Parallel dry cell side,
 using Thevenin's theorem,
 it be changes.

On any conditions, the current of a dry cell becomes half. ??

Optimal resistance combination of a dry cell and a miniature bulb

Whenever the resistance R_L of a miniature bulb of the conditions from which the current which flows from each dry cell serves as half of the current which flows into a miniature bulb, is a half of the internal resistance r_0 of a dry cell?

$$I = E_0 / (r_0/2 + R_L) = E_0 / r_0$$

In case of R matching, maximum electric power is sent

RFAnalog theory (Always consider Refraction)

The law of Ohm's Law for a dry cell, a miniature bulb

RFAnalog

Time: T

Mr. RFAnalog's theory considers both of incidence and reflection of a direct current (As if frequency infinitely nearly equal 0).

Dry Cell side; $1 - 0.5 = 0.5$ (A)

Bulb side: $2 - 1 = 1$ (A)

Compound current at the arbitrary time T

Electric meter is measured.

Even if it uses parallel regardless of the length of the electromotive force of a battery, current, internal resistance, or an electric wire, neither the internal resistance of two parallel batteries nor electromotive force changes.

The law of Ohm ,AC, and a miniature bulb

If dividing the time period between + or - , it is the same case as a direct current.

$$(+/-)1 - (+/-) 0.5 = (+/-) 0.5 \text{ (A)}$$

$$(-/+)1 - (-/+) 0.5 = (-/+) 0.5 \text{ (A)}$$

In practice, since the voltage and current from a power supply are never constant and it changes, such a view will become important if the length of a line becomes long by high frequency.

The difference between an analog, digital ones, and RF

Physicochemically measurable things, such as sound, electricity and electromagnetic waves (an electric wave, light, and radiation), frequency, heat, time, space, and gravity, or the thing decided by human feeling, such as a hobby and an idea, liking, a tendency, love

Analog

Change of a limited and complicated continuous quantity is expressed.

Digital

Change of a limited and infinite discontinuous quantity is expressed.

Time, Frequency, Space

RF(Radio Frequency)

Continuation in limited and infinite time and frequency space and change of a discontinuous quantity are denoted by a comparatively simple waveform.
